PORTALDOT HACKER HOUSE 2026 · CIPOKLEAN

PotFeeds + PotKeeper

Agent-run price feeds and automation for Portaldot

POTFEEDS.VERCEL.APP

01

The gap

Portaldot V3 has no price feeds and no automation.

Mainnet went live Oct 24 2026 with an empty oracle module and no keeper layer.

What breaks without it

Lending

No price means no safe collateral or liquidations.

Perps and vaults

No mark price and no automatic risk switches.

Every app

Each team rebuilds its own fragile price bot.

02

What we built

How it works

01

Feeder agents pull prices from four exchanges and drop outliers.

02

FeedAggregator finalizes each round at the median of agent answers.

03

Keeper agents watch KeeperRegistry jobs and simulate before acting.

04

The target app runs its action and the keeper is paid on-chain.

Agents with judgment

Decide

Publish on a price move or a heartbeat. Skip otherwise to save gas.

Defend

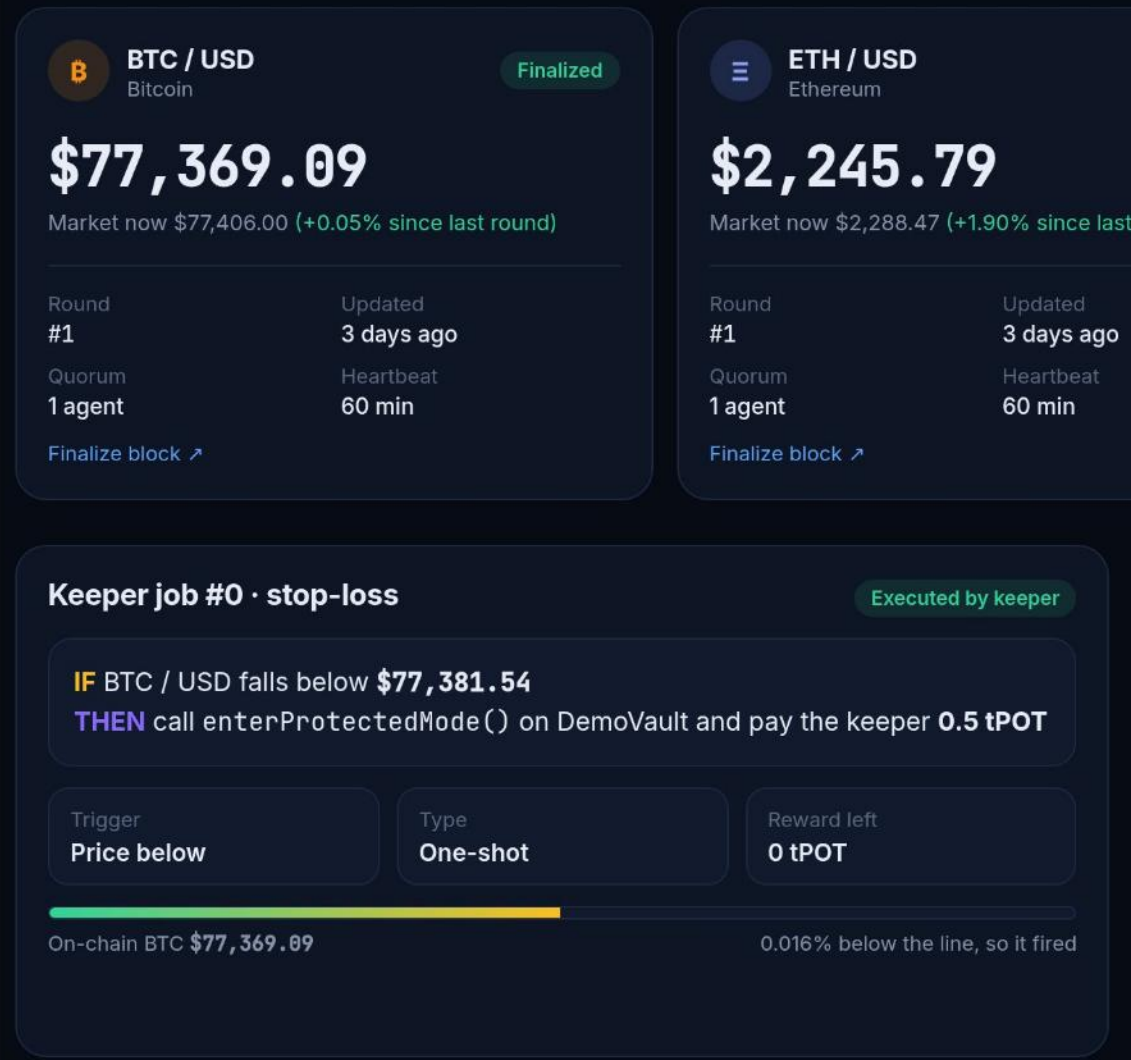

Pause a feed when exchanges disagree beyond 3%.

Act

Simulate every keeper job first so failed calls cost nothing.

Live on testnet

potfeeds.vercel.app reads Portaldot V3 testnet directly.

03

Proof

On-chain today

3

Feeds finalized

1

Stop-loss fired

0.5

11

Tests passing

Evidence trail

EVENT	VALUE	TESTNET BLOCK
BTC / USD round 1	$77,369.09	265087
ETH / USD round 1	$2,245.79	265088
DOT / USD round 1	$0.9518	265090
Keeper job #0 executed	Vault protected	265093

04

Why it wins

Every DeFi app on Portaldot needs this first.

Shared infrastructure with a Chainlink-style interface that any dApp reads in one call.

Business model

dApps

Pay a fee per feed they subscribe to.

Job owners

Fund keeper rewards per automated job.

Operators

Run feeder and keeper agents and earn POT.

Road to mainnet

Now

Live on V3 testnet with three feeds and a keeper.

Next

Independent operators with staking and slashing.

Then

More feeds and partner dApp integrations.

Mainnet

Deploy once the V3 EVM RPC is public.

Back PotFeeds to mainnet

Ecosystem support turns this testnet proof into V3's default oracle.
